

Space and bandwidth have always been a present issue in the realm of Internet and phone service in America. And with the boom of smart phones across the country, people are even more linked to Internet and data usage, no matter where they are. However, data plans and extensive marketing of data usage on smart phones lead many customers to buy out the maximum amount of data available on phones like the iPhone and the Droid.

Users are often biting off more than they can chew and though many companies like AT&T have recently opted to do away with their unlimited data plans, many consumers remain on these plans, giving them an unprecedented amount of space compared to users who genuinely need that amount of data.

The FCC and major cell phone network providers should work together to encourage users to limit their data usage on cell phone devices, opening up more room for experimentation and expansion of existing 3G and 4G networks.
